

# Double-Spey cast with a two-handed rod

Stand with the body facing in the direction of the cast, with the fly-line downstream....

Wind direction

Water flow

Lift the rod-tip up slowly, inclined towards the far bank and use the fly-rod to place the fly-line upstream....

During this move a loop may be thrown into the fly-line to put the water anchor in the correct position below the caster and to allow for the flow of the river taking the fly line back downstream.....

Move rod-tip low to high

Starting with the rod-tip close the the water, peel the fly-line back downstream, gradually raising and accelerating the rod-tip until it passes over the water-anchor position and at this point circle-up into the key position.....

Make the forward cast in the normal manner
